## Steps to Add a New Wiki Page

Error: Macro TracGuideToc(None) failed

'NoneType' object has no attribute 'find'

You can create a new wiki page by typing the <u>CamelCase</u> name of the page in the quick-search field at the top of the page, or by trying to view a wiki page of that name. Note that a page is "orphaned" by default until it is linked to from another page.

You must be granted permission to create wiki pages. If you don't see the **Create this page** button when visiting a non-existent wiki page, you lack appropriate permission. Contact your local Trac administrator for more information.

A new wiki page can also be created as follows:

- 1. Choose a name for your new page. See WikiPageNames for naming conventions.
- 2. Edit an existing page or any other resource that support <u>WikiFormatting</u> and add a <u>link</u> to your new page. If your page name is <u>CamelCase</u>, you can simply type the page name, provided the <u>ignore missing pages</u> <u>option</u> is disabled (the default).
- 3. Save your changes.
- 4. Follow the link you created to take you to the new page.
- 5. Click the **Create this page** button to enter edit mode and add content to your new page.
- 6. Save your changes to publish your page.

## Rename a page

While choosing a good <u>page name</u> is important for usability purposes, you can always rename the page later. You will need the WIKI\_RENAME permission to rename pages.

When renaming a page, you'll be offered the possibility to create a page at the old location that contains a link to the new page, so that links pointing to the old location are not "dangling" (i.e. pointing to a non-existent page).
