

Using Search

Trac has a built-in search engine to allow finding occurrences of keywords and substrings in wiki pages, tickets and changeset descriptions.

Using the Trac search facility is straightforward and its interface should be familiar to most www users.

Apart from the [Search module](#), you will also find a small search field above the navigation bar at all time. It provides convenient access to the search module from all pages.

Quickjumps

For intermediate and advanced use, Trac has a useful way to quickly navigate to a given resource, named **quickjumps**.

If you enter a [TracLink](#) in the search field above the navigation bar, Trac will recognize this and assume you know where you're going.

For example:

- [42] -- Opens change set 42
- #42 -- Opens ticket number 42
- {1} -- Opens report 1

Note: *This is a particularly useful feature to quickly navigate to a specific issue ticket or changeset.*

Advanced: Disabling Quickjumps

To disable the quickjump feature for a search keyword - for example when searching for occurrences of the literal word TracGuide - begin the query with an exclamation mark (!).
