Syntax Coloring of Source Code

Trac supports language-specific syntax highlighting of source code in <u>wiki formatted</u> text and the <u>repository</u> <u>browser</u>.

To do this, Trac uses external libraries with support for a great number of programming languages.

Currently Trac supports syntax coloring using one or more of the following packages:

- <u>?GNU Enscript</u>
- <u>?SilverCity</u>

To activate syntax coloring, simply install either one (or more) of these packages. No additional configuration is required, however to modify the colors, have a look at trac/htdocs/css/code.css.

When in use, Trac will automatically prioritize SilverCity highlighting over Enscript if possible, (see note below).

If neither package is available, Trac will display the data as plain text.

Note: Enscript supports a greater number of languages, however SilverCity is generally faster since it is a library and isn't executed in an external process.

About SilverCity?

SilverCity uses the lexer from <u>?Scintilla</u>. Scintilla supports more languages than SilverCity implements. If you want to add a language to SilverCity supported by Scintilla, it's not very difficult. See <u>?SilverCityAddLanguage</u> for some information how.

Syntax Coloring Support

	SilverCity	Enscript
