

Wiki Page Names

Wiki page names are written using CamelCase. Within a wiki text, any word in CamelCase automatically becomes a hyperlink to the wiki page with that same name.

Page names must follow these rules:

1. The name must consist of **alphabetic characters only**. No digits, spaces, punctuation, or underscores are allowed.
2. A name must have at least two capital letters.
3. The first character must be capitalized.
4. Every capital letter must be followed by one or more lower-case letters.
5. The use of slash (/) is permitted to create a hierarchy inside the wiki. (See SubWiki and ParentWiki macros in the ?MacroBazaar which provide a way to list all sub-entries and a link up the hierarchy respectively.)

If you want to create a wiki page that doesn't follow CamelCase rules you could use the following syntax:

```
[wiki:Wiki_page]
```

This will be rendered as:

Wiki_page?
